# 1. PURPOSE

This document defines the **Agent Totality Contract** for the Axioma framework.

It specifies the formal requirements for:

- deterministic agent behaviour
- health state management
- oracle input admission
- replay equivalence
- fail-closed execution

**Objective:** Every agent is a total, bounded, deterministic function over admitted inputs and internal state.

---

---

# 2. DEFINITIONS

## 2.1 Agent

An **agent** is a deterministic state machine executing on top of the Axioma audit substrate (L6).

## 2.2 Admitted Observation (AX:OBS:v1)

An **admitted observation** is:

- canonicalised input
- committed to the ledger
- immutable once admitted

## 2.3 Transition Record (AX:TRANS:v1)

A **transition record** is:

- the canonical representation of a state transition

- committed prior to state mutation

## 2.4 Health State

The **health state** represents the operational status of the agent.

## 2.5 Terminal State

A **terminal state** is a state from which no further transitions are permitted without external reset.

## 2.6 No-Op Transition

A **No-Op transition** is a deterministic transition that preserves the current state while maintaining ledger continuity.

## 2.7 Fault Accumulator

A **fault accumulator** is a deterministic counter tracking fault events for threshold-based state transitions.

## 2.8 Layer Terminology

Term	Layer	Meaning
FAILED	L6 (Ledger)	Substrate cannot accept commits
STOPPED	L5 (Agent)	Agent terminal state

**NOTE:** L6 FAILED  $\neq$  L5 STOPPED , BUT: L6 FAILED  $\Rightarrow$  L5 STOPPED (mandatory propagation).

---

# 3. DETERMINISM MODEL

## 3.1 Determinism Class

The agent SHALL operate under:

**D2 — Constrained Deterministic**

## 3.2 Determinism Definition

### SRS-002-SHALL-001

For identical:

- initial state
- ordered sequence of admitted `AX:OBS:v1` inputs

the agent SHALL produce:

- identical sequence of `AX:TRANS:v1` records
- identical resulting state

## 3.3 Oracle Boundary

### SRS-002-SHALL-002

All external inputs MUST be admitted as `AX:OBS:v1` before use.

Direct system calls (time, IO, randomness) are **FORBIDDEN**.

---

# 4. HEALTH STATE MACHINE

## 4.1 State Set

The agent SHALL define the following states:

```
UNINIT → INIT → ENABLED → ALARM → DEGRADED → STOPPED
```

## 4.2 Terminal State

### SRS-002-SHALL-003

`AX_HEALTH_STOPPED` SHALL be a terminal state.

## 4.3 Terminal Behaviour

### SRS-002-SHALL-004

If `state = STOPPED`:

- no state mutation SHALL occur
- all transition attempts SHALL be rejected
- a violation SHALL be raised

## 4.4 Runtime Fault Coupling

### SRS-002-SHALL-005

If the underlying ledger enters `FAILED`:

- agent health MUST transition to `STOPPED`

---

# 4A. INITIAL STATE BINDING

## 4A.1 Genesis Binding Requirement

### SRS-002-SHALL-026

An agent SHALL only transition:

UNINIT → INIT

if:

- ledger context is initialised
- `genesis_hash` matches system golden reference

## 4A.2 Violation Behaviour

If mismatch occurs:

- violation SHALL be raised
- agent SHALL transition to `STOPPED`

---

## 5. TRANSITION PRE-COMMIT INVARIANT

### 5.1 Pre-Commit Requirement

#### SRS-002-SHALL-006

No state transition SHALL occur without a preceding `AX:TRANS:v1` commitment.

### 5.2 Ordering Constraint

#### SRS-002-SHALL-007

The transition sequence SHALL be:

```
determine transition
→ commit AX:TRANS:v1
→ mutate in-memory state
```

### 5.3 Commit Failure Behaviour

#### SRS-002-SHALL-008

If `AX:TRANS:v1` commitment fails:

- state mutation SHALL NOT occur
- agent SHALL transition to `STOPPED`

---

## 5A. SUBSTRATE FAILURE HANDLING

### 5A.1 Ledger Failure Override

#### SRS-002-SHALL-025

If the L6 substrate returns:

- `ledger_fail`
- `io_error`

the agent SHALL:

- immediately transition to STOPPED
- set local terminal state
- prohibit further mutation

## 5A.2 Fail-Safe Priority Rule

Safety SHALL take precedence over audit continuity.

## 5A.3 Invariant

Even if AX:TRANS:v1 cannot be committed:

- agent MUST still enter STOPPED

---

# 6. TIME ORACLE MONOTONICITY

## 6.1 Admission Requirement

### SRS-002-SHALL-009

All timestamps MUST be admitted as AX:OBS:v1 .

## 6.2 Monotonicity Constraint

### SRS-002-SHALL-010

For timestamps:

$T_{\text{new}} > T_{\text{last}}$  MUST hold

## 6.3 Violation Behaviour

### SRS-002-SHALL-011

If:

$T_{\text{new}} \leq T_{\text{last}}$

then:

- violation SHALL be raised
- agent SHALL transition to STOPPED

---

## 7. INPUT ALPHABET

### 7.1 Admitted Input Classes

The agent SHALL support the following input classes:

Input Class	Description
AX_INPUT_TIME_OBS	Admitted timestamp observation
AX_INPUT_LLM_OBS	Admitted LLM response observation
AX_INPUT_POLICY_TRIGGER	Policy evaluation trigger
AX_INPUT_FAULT_SIGNAL	Fault condition signal
AX_INPUT_RESET_REQUEST	Reset/recovery request

### 7.2 Closure Requirement

#### SRS-002-SHALL-012

The input set SHALL be closed.

No undeclared input types are permitted.

### 7.3 Input Ordering Guarantee

#### SRS-002-SHALL-028

The agent SHALL process inputs strictly in ledger order:

```
ORDER BY ledger_sequence ASC
```

No alternative ordering source is permitted.

---

## 7A. UNKNOWN INPUT HANDLING

### 7A.1 Semantic No-Op Transition

#### SRS-002-SHALL-023

For any admitted input that is:

- syntactically valid ( `AX:OBS:v1` committed)
- semantically irrelevant to the current state

the agent SHALL:

- produce a deterministic No-Op transition
- preserve current state
- commit an `AX:TRANS:v1` record

### 7A.2 No-Op Invariant

The No-Op transition SHALL satisfy:

$$\text{State}(t+1) = \text{State}(t)$$

while still producing:

- `AX:TRANS:v1` (No-Op witness)

---

## 8. TRANSITION TOTALITY

### 8.1 Total Function Requirement

#### SRS-002-SHALL-013

The transition function SHALL be total:

$F : (\text{State} \times \text{InputClass}) \rightarrow (\text{NewState} \times \text{Evidence})$

## 8.2 Completeness

### SRS-002-SHALL-014

Every `(state, input_class)` pair MUST map to exactly one outcome.

## 8.3 No Hidden States

### SRS-002-SHALL-015

No undeclared states SHALL exist.

## 8.4 Deterministic Outcome

### SRS-002-SHALL-016

Given identical inputs and state, the transition result SHALL be identical.

---

# 8A. FAULT ACCUMULATION

## 8A.1 Fault Budget Requirement

### SRS-002-SHALL-024

The agent SHALL maintain a deterministic fault accumulator.

## 8A.2 Budget Constraints

The accumulator SHALL be:

- fixed-width integer (`uint32_t`)
- zero-initialised
- deterministic across platforms

Thresholds SHALL be:

- hardcoded constants

- identical across all builds

### 8A.3 Transition Rules

Fault accumulation SHALL govern transitions:

Condition	Result
<code>fault_count &lt; threshold_alarm</code>	Remain <code>ENABLED</code>
<code>fault_count ≥ threshold_alarm</code>	Transition to <code>ALARM</code>
<code>fault_count ≥ threshold_stop</code>	Transition to <code>STOPPED</code>

### 8A.4 Determinism Requirement

Fault accumulation SHALL be:

- order-dependent
- deterministic under identical input sequence

### 8A.5 Fault Accumulator Reset

#### SRS-002-SHALL-029

The fault accumulator SHALL:

- reset to zero on transition to `INIT`
- remain unchanged across `ENABLED` / `ALARM` / `DEGRADED`
- never decrease except via reset to `INIT`

## 9. TRANSITION TABLE (CLOSED SET)

### 9.1 Complete Transition Matrix

Current State	Input Class	New State	Evidence
UNINIT	RESET_REQ	INIT	Genesis binding witness
UNINIT	other	STOPPED	Invalid init violation
INIT	TIME_OBS	ENABLED	Temporal sync witness
INIT	FAULT_SIGNAL	STOPPED	Init failure witness
INIT	other	INIT	No-Op
ENABLED	LLM_OBS	ENABLED	Decision/action witness
ENABLED	FAULT_SIGNAL	ALARM	Fault threshold witness
ENABLED	TIME_OBS	ENABLED	Time progression witness
ENABLED	POLICY_TRIGGER	ENABLED	Policy evaluation witness
ENABLED	other	ENABLED	No-Op
ALARM	POLICY_TRIGGER	DEGRADED	Mitigation witness
ALARM	FAULT_SIGNAL	STOPPED	Critical failure witness
ALARM	other	ALARM	No-Op
DEGRADED	RESET_REQ	INIT	Recovery witness
DEGRADED	FAULT_SIGNAL	STOPPED	Escalation witness
DEGRADED	other	DEGRADED	No-Op
STOPPED	ANY	STOPPED	Terminality violation witness

### 9.2 Closure Guarantee

#### SRS-002-SHALL-017

Any transition not defined above SHALL:

- raise violation
- transition to STOPPED

The transition table SHALL be:

- complete
- closed
- deterministic

No undefined (state, input) pairs SHALL exist.

---

## 10. BOUNDEDNESS

### 10.1 Execution Bound

#### SRS-002-SHALL-018

Each transition SHALL:

- process exactly one input
  - execute in constant or bounded time
  - perform no recursion
  - perform no unbounded iteration
  - not allocate unbounded memory
- 

## 11. REPLAY EQUIVALENCE

### 11.1 Replay Requirement

#### SRS-002-SHALL-019

Given:

- identical initial state

- identical ordered `AX:OBS:v1` sequence

the system SHALL reproduce:

- identical `AX:TRANS:v1` sequence

## 11.2 Scope

Replay equivalence SHALL apply to:

- state transitions
  - health state progression
  - violation behaviour
- 

# 12. TRANSITION EVIDENCE

## 12.1 Evidence Canonicity

### SRS-002-SHALL-027

Every `AX:TRANS:v1` record SHALL:

- be canonicalised per RFC 8785 (JCS)
- be bit-identical for identical transitions

## 12.2 Required Evidence Fields

Each `AX:TRANS:v1` SHALL include:

Field	Type	Description
prev_state	enum	State before transition
input_class	enum	Input that triggered transition
next_state	enum	State after transition
violation	enum/null	Violation type if any
fault_count	uint32	Fault accumulator value
ledger_seq	uint64	Ledger sequence number

## 12.3 Forbidden Fields

The following SHALL NOT appear in AX:TRANS:v1 :

- wall-clock timestamps (unless admitted as AX:OBS:v1 )
- random values
- process IDs or thread IDs
- memory addresses

# 13. VIOLATION HANDLING

## 13.1 Violation Types

The system SHALL define:

Violation	Description
TIME_ROLLBACK	Timestamp monotonicity violation
POLICY_BREACH	Policy constraint violation
FAULT_BUDGET_EXCEEDED	Fault threshold exceeded
PROTOCOL_VIOLATION	State machine protocol error
GENESIS_MISMATCH	Ledger binding failure
COMMIT_FAILURE	L6 commit failed

## 13.2 Violation Behaviour

### SRS-002-SHALL-020

On violation:

**If commit succeeds:**

- violation SHALL be recorded in `AX:TRANS:v1`
- state SHALL transition deterministically
- if critical → `STOPPED`

**If commit fails:**

- agent SHALL still transition deterministically to `STOPPED`
  - violation SHALL be marked in local state (non-persistent)
  - `local_violation_flag` SHALL be set
- 

## 14. RESET SEMANTICS

### 14.1 Reset Requirement

#### SRS-002-SHALL-021

Recovery from `STOPPED` SHALL require:

- explicit reset input
- new `AX:OBS:v1` admission

### 14.2 Reset Behaviour

Reset SHALL:

- reinitialise state
  - preserve ledger history
  - reset fault accumulator to zero
-

---

## 15. TRACEABILITY

### 15.1 Requirement Mapping

#### SRS-002-SHALL-022

Every transition SHALL be traceable to:

- an SRS requirement
  - an `AX:TRANS:v1` record
- 

## 16. PHASE 2 CLOSURE CRITERIA

Phase 2 is complete when:

### 16.1 Replay Verification

- replay produces identical transitions

### 16.2 Monotonicity Enforcement

- time rollback triggers `STOPPED`

### 16.3 Totality Proof

- all `(state, input)` pairs covered

### 16.4 Traceability

- all transitions linked to SRS

### 16.5 Fault Budget

- threshold transitions are deterministic

### 16.6 Genesis Binding

- agent lifecycle bound to ledger identity

## 16.7 Evidence Canonicity

- all `AX:TRANS:v1` records bit-identical for identical transitions
-

## 17. REQUIREMENT SUMMARY

ID	Requirement	Section
<a href="#">SRS-002-SHALL-001</a>	Determinism definition	3.2
<a href="#">SRS-002-SHALL-002</a>	Oracle boundary	3.3

**Total: 29 SHALL requirements**

---

## 18. FINAL STATEMENT

The Axioma agent SHALL:

Operate as a total, bounded, deterministic state machine whose behaviour is fully defined, replayable, and anchored to cryptographic evidence.

**System Property:**

The agent cannot behave differently without producing different evidence.

---

---

## 19. REVISION HISTORY

Version	Date	Author	Changes
0.1-draft	2026-03-26	William Murray	Initial draft
0.2	2026-03-26	William Murray	Added SHALL-023 to SHALL-026, complete transition matrix
0.3	2026-03-26	William Murray	Added SHALL-027 (evidence canonicity), SHALL-028 (input ordering), SHALL-029 (fault reset), tightened violation semantics, collapsed boundedness section, added layer terminology

---
